

# Nucleic Acids Overview

**Focus on:**

- Structure of DNA/RNA – can I draw it or interpret drawings
- DNA Replication – can I describe the basic process
- RNA Transcription – can I explain role of each type of RNA
- Biosynthesis of Proteins – can I explain the basic process
- Miscellaneous Topics – could I discuss each one
  - Cancer/Chemotherapy
  - Genetic Engineering
  - Human Genome Project
  - Genetic Code (Codons)

# Structure

## 5 Bases

## Focus on:

- Molecules given on cheat sheet
- Can I # the molecules and recognize which N-H group reacts
- Purines/Pyrimidine pairs G/C and A/T or A/U

Pyrimidine

Uracil (U)  
RNA only

Thymine (T)  
DNA only

Cytosine (C)  
both DNA and RNA

Purine

Adenine (A)

Guanine (G)

# Structure Sugars

### Focus on:

- Molecules given on cheat sheet
- Can I # the molecules and recognize which OH groups react
- Missing 2' OH on deoxyribose

# Nucleosides

### Focus on:

- Given Table 31.1 on cheat sheet
- Base + Sugar
- 2° Amine + Alcohol  $\rightarrow$  3° Amine
- Dehydration Reaction
- Be able to draw them

**Cytidine**  
A ribonucleoside

**Deoxyguanosine**  
A deoxyribonucleoside

# Nucleotides

### Focus on:

- Given Table 31.1 on cheat sheet
  - Base + Sugar + Phosphate
  - Phosphate Anhydride Bonds
  - Draw and Name them
- Dehydration Reaction
  - Naming/Abbreviations
  - Phosphates can connect to Ribose 2',3',5', Deoxyribose 3',5'

**3'-dCMP**

**5'-dGTP**

# Parts of Nucleotide

Components of Nucleic Acid (DNA), Nucleoside and Nucleotide

Namrata Heda

DNA

## Focus on:

- Draw a small segment
- Double Helix with Bases = rungs
- Held together by Hydrogen Bonds
- Complementary

# Complimentary Base Pairs

## Focus on:

- Hydrogen Bonds
- G/C and T/A
- Built in Error Checking

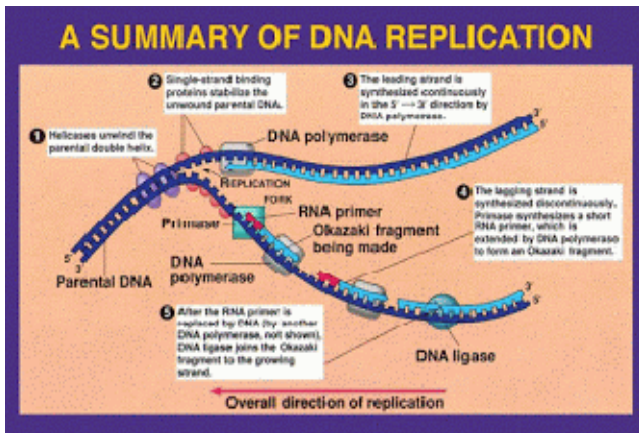

# Replication

**Definition:** process by which DNA is duplicated

- Complementary nature is key to duplication
- Each new strand is 1 template + 1 new complementary strand
- Strands copied differently
  - Towards the point of unwinding → continuous synthesis
  - Away from the point of unwinding → fragmented synthesis
- Rigorous error checking: 1/Billion error rate

# DNA vs RNA

## Differences between DNA and RNA

DNA	RNA
1. Double Strand	1. Single Strand
2. Dexoyribos e	2. Ribose
3. T	3. U
4. Store Information	4. mRNA/rRNA/tRNA Blueprint/Machinery/Du mp Truck
5. Unmodified	5. Heavily Modified

# RNA - General

## RNA – Summary

- 3 main types
  - rRNA = ribosomal → machinery (80%)
  - mRNA = messenger → blueprint
  - tRNA = transfer → dump truck
- Single Strand
- U instead of T
- Complimentary to DNA (HB)
- Heavily Modified
  - Methylation (add CH<sub>3</sub>)
  - Saturation of C=C
  - Isomerization of ribose

rRNA

## Ribosomal RNA

- 80% of RNA
- Combines with proteins to make ribosomes
- Machinery to synthesis proteins (30-35% rRNA, 60-65% protein)
- Complicated structure (skip)

mRNA

## Messenger RNA

- Carries information from DNA to Ribosome
- Blueprint
- Undergoes some modification
- More than just Blueprint
  - Includes 5' cap group
  - Untranslated regions – where ribosome can interact
  - Coding region
  - 3' tail

tRNA

## Allosteric Regulation:

- Transfer
- Dump truck
- Bring AA to Ribosome – Interacts with ribosome, AA and mRNA
- Unique cloverleaf shape – 3 important regions

- 1 - Acceptor Region – binds to AA
- 2,4 – Ribosome handles – interact with ribosome
- 3 - Anticodon region – binds to mRNA

# Other Types of RNA

## ncRNA (Noncoding RNA)

- Control flow of genetic information
- Know 1 example
- Hot new area to research for curing genetic diseases

Type	Size	Location	Purpose
Micro (miRNA)	20-25	Cytoplasm	Stop translation by blocking ribosomes
Small Nuclear (snRNA)	60-200	Nucleus	Control post transcription modification
Small Nucleolar (snoRNA)	70-100	Nucleolus	Control modification of rRNA
Small Interfering (siRNA)	20-25	Cytoplasm	Stop translation by triggering mRNA destruction

siRNA

## siRNA

- Stops translation by signaling the destruction of mRNA before it is translated into a protein

### a Small interfering RNA

# Genetic Code

## Genetic Code:

- Given on cheat sheet, just know how to use it
- Understand complementary relationships
  - G/C and A/T/U
- Convert sequences
  - DNA  $\leftrightarrow$  mRNA
  - mRNA  $\leftrightarrow$  tRNA
  - DNA  $\leftrightarrow$  AA Sequence

Cancer

## Cancer:

- **Oncogenes:** proteins that code for cell growth
- **Cancer:** uncontrolled/unregulated cell growth/reproduction caused by loss of oncogene regulation
- **Tumor-Suppressor Genes:** block/reduce cancer by causing apoptosis if cell is damaged
  - 20+ discovered for rare cancers
  - Example p53 is inactive in about 50% of cancers
  - Suppression of gene allows cancer to develop
- **Apoptosis:** cause cell destruction
  - release of cytochrome C from mitochondria activates caspases (digestive enzyme) → breaks apart cell machinery
- **Treatments:**
  - Radiation → kills fast growing cells
  - Chemotherapy → kills fast growing cells
  - Genetics → activate tumor-suppressing genes
  - Example: 5-fluoro-uracile inhibits production of thymine

Thymine

5-Fluoro-Uracile

# Human Genome Project

## Human Genome Project:

- Heredity is controlled by DNA
- Genetic Diseases effect 8% humans
- Started 1998 → Map 3 billion base pairs
- Finished 2001!

## Results:

- Codes for 23,000 enzymes but potentially could code for 100,000+ (junk DNA)
- 98% of Genome  $\neq$  code proteins
  - Unknown or no function
  - Junk DNA
  - Regulation
  - Unused/Abandoned genes
- 1000 of genetic tests developed

## Goal:

- Cure Genetic Diseases – easier said than done, but some successes

THE G-NOME PROJECT

# Genetic Engineering

## Genetic Engineering

- Laboratory technique for controlling/causing genetic change
- DNA polymerase chain reaction: copies specific genes over and over
- Restriction Endonucleases: split DNA at very specific points
- Insertion: Ability to insert genetic material
- Ligases: covalently bond DNA back together
- Recombinant DNA: DNA whose base pairs have been rearranged to contain new information

### Examples:

- Yeast/Bacteria → Insulin, Anemia drugs, Interferon
- Agriculture → GMO crops, pesticide resistance

### Close to Home By John McPherson

# Mutation

# Mutation

- Mutation: alteration to DNA that changes genome in child but not parent
  - Good (Superpowers) or Bad (Cancer, diseases)
  - Evolution
- Mutagens: cause genetic damage
  - Ionizing Radiation – UV, x-rays, cosmic rays
  - Chemicals
  - Radioactive decay
  - Heavy Metals
  - Viruses
- Anti-oxidants

## Radiation

**UV Radiation**  
both natural sunlight  
and tanning beds

**X-Rays**  
medical, dental,  
airport security screening

## Chemicals

**Cigarette Smoke**  
contains dozens of  
mutagenic chemicals

**Nitrate and Nitrite  
Preservatives**  
in hot dogs and  
other processed meats

**Barbecuing**  
creates mutagenic  
chemicals in foods

**Benzoyl Peroxide**  
common ingredient  
in acne products

## Infectious Agents

**Human Papillomavirus  
(HPV)**  
sexually transmitted virus

**Helicobacter pylori**  
bacteria spread through  
contaminated food

## Examples:

- Cancer
- Superpowers
- Evolution

# Translation General (I)

## **Translation – General**

- Dfn: Biosynthesis of Proteins (DNA → RNA → Protein)
  - Step 0: Preparation
  - Step 1: Initialization
  - Step 2: Elongation
  - Step 3: Termination
- Know the roles of:
  - DNA
  - mRNA, tRNA, rRNA
  - Ribosomes – 2 subunits, 3 binding sites (1 mRNA, 2-tRNA)
  - AA
  - ATP

# Translation General (II)

1. A small ribosomal subunit binds to mRNA; an initiator tRNA with the anticodon UAC pairs with the codon AUG.

2. The large ribosomal subunit completes the ribosome. Initiator tRNA occupies the P site. The A site is ready for the next tRNA.

3. A tRNA-amino acid approaches the ribosome and binds at the A site.

4. Two tRNAs can be at the ribosome at one time; the anticodons are paired to the codons.

5. As tRNA leaves the P site, its amino acid is passed to tRNA-amino acid at the A site.

6. The tRNA-peptide has moved over, making room for the next tRNA-amino acid at the A site.

# Translation

## Step 0 - Preparation

## Translation – Step 0 – Preparation

- DNA transcribed to mRNA
- mRNA moves from nucleus to cytoplasm
- mRNA binds to 5+ ribosomes
- tRNA binds to AA (requires an enzyme)

# Translation

## Step 1 - Initiation

## Translation – Step 1 – Initiation

- AUG (Met) = start codon
  - Capped to prevent reaction on amine end
- Ribosome binds to mRNA at/near the initiator/start codon

1. mRNA binds to small subunit of ribosome.

2. f-Met tRNA binds.

3. Large subunit binds.

# Translation

## Step 2 - Elongation

## Translation – Step 2 – Elongation

- tRNA HB to mRNA anticodon
- Ribosome makes peptide bond between AA
- tRNA breaks off (to be reused)
- Process repeats....

# Translation

## Step 3 - Termination

### Translation – Step 3 – Termination

- Elongation stops when a TC/nonsense codon is reached
- Last tRNA is hydrolyzed
- Ribosomes separate and release mRNA and finished protein

# Big Picture: Central Dogma of Biology

# Central Dogma of biology

# Hydrogen Bonding

## Hydrogen Bonding:

- Complementary - Between Base Pairs in DNA or DNA/RNA
- Structure → specific shapes of proteins and RNA
